

Software Studio

軟體設計與實驗

Lab 0

Environment Setting

Hung-Kuo Chu

Department of Computer Science
National Tsing Hua University

Goal

- Go through all basic steps
 - VS Code setup and config
 - Create your own first h5 project
- Running an example on chrome

Visual Studio Code

Visual Studio Code

- Why we select VS Code?
 - Native support for version control
 - Built-in debugger
 - Integrated terminal
 - Large community
- 10 reasons to use VS Code

Install VS Code

- Refer to the Appendix01 VS Code

Today's Goal: Light Switch !

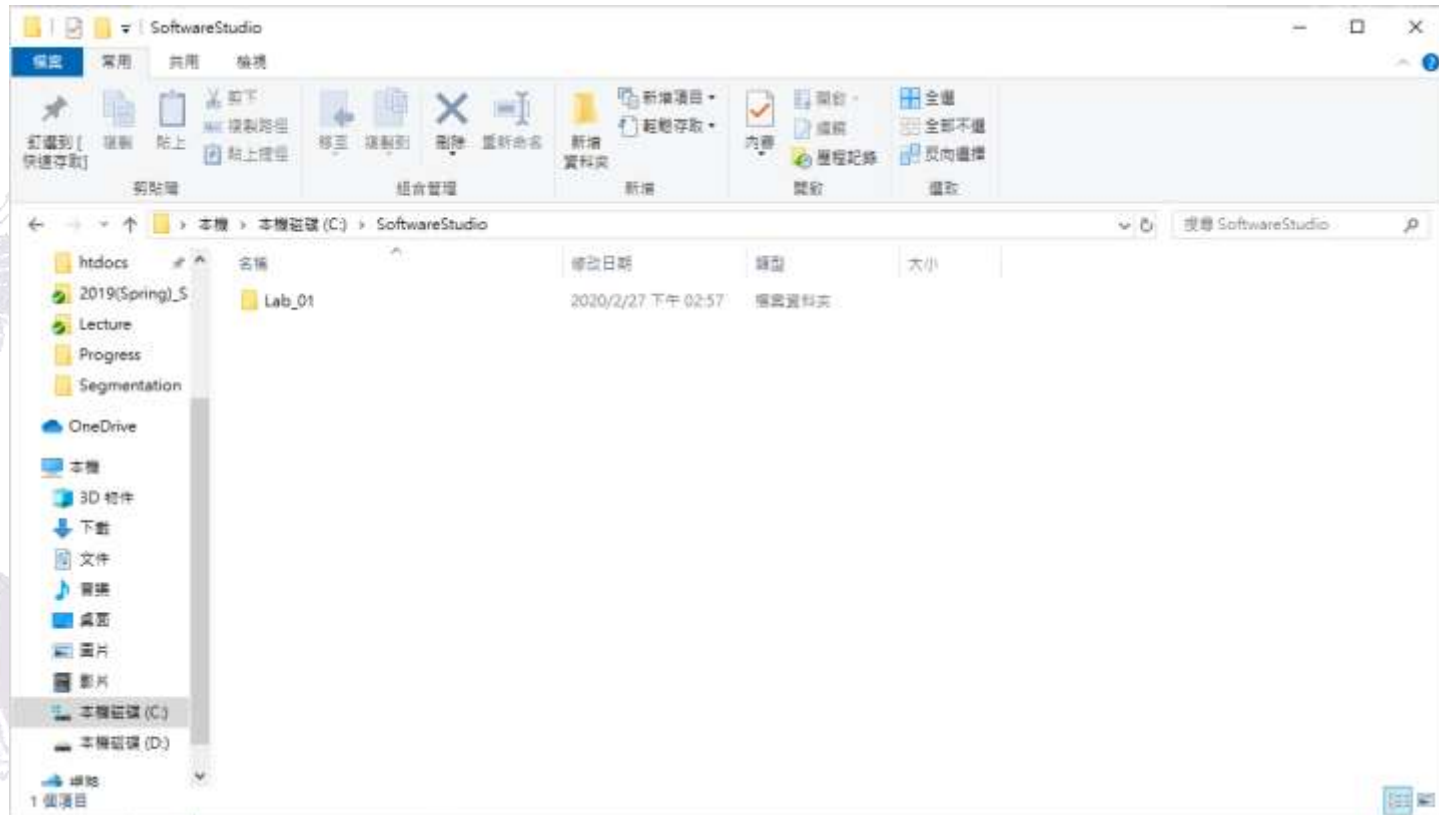

Let's Start From an Empty Project !

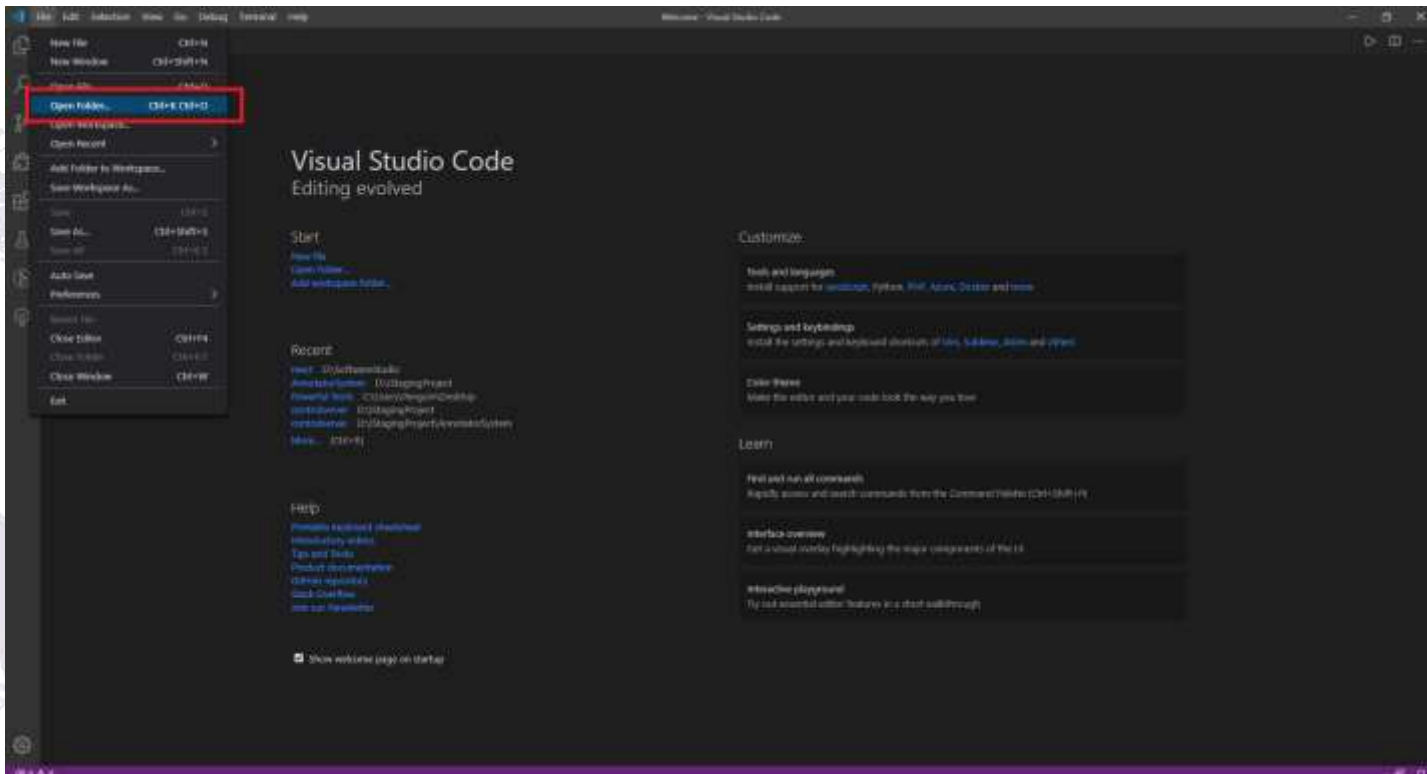

Create New Project

- We want to start a new project in VS Code.
- First, create a new folder.

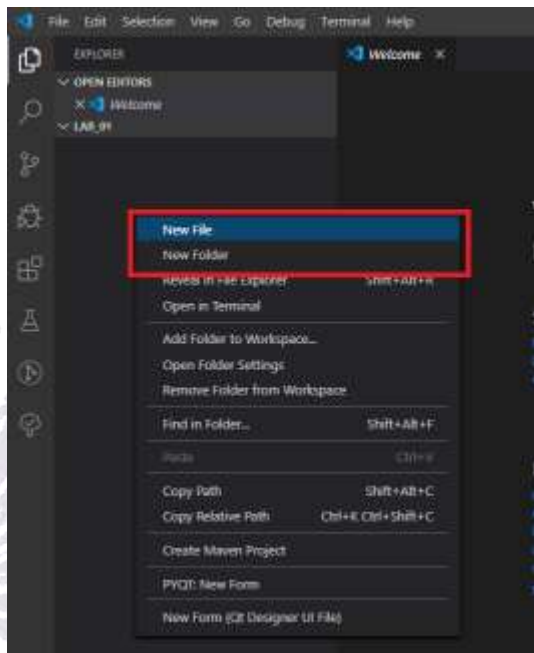

Open Project

- Open VS Code, then select tool bar 
“File → Open Folder” to select the folder we created.

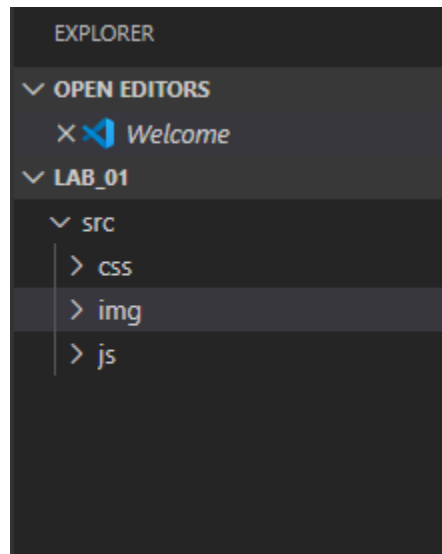

Create New File or Folder

- Click right mouse button on explorer window, then you can find "**New File**" and "**New Folder**".
- Or, on the header of your project folder. There is a tool bar also has the same function.

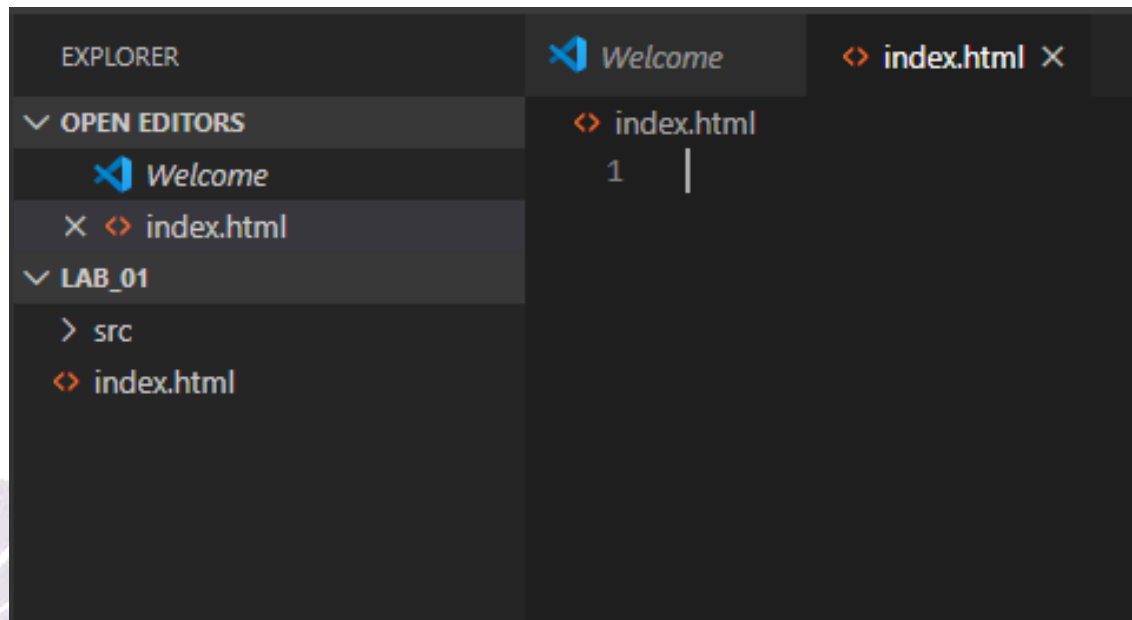

Create New Folders

- In order to manage our project files easily and efficiently, we need to add some folders to place our source files.
- Create **src**, **css**, **img**, **js** folders and put the last three folders into src folder.

Create New File

- Now create a new file named “**index.html**”.
- Select it in explorer then you can edit it.

Edit HTML File

- Paste the example code into it.

```
<!DOCTYPE html>
<html>
  <head>
    <title>Lab0-Example</title>
  </head>
  <body>
    <h1>Lab0 - Light Switch !</h1>
  </body>
</html>
```

Open your html!

- Open your html file in folder, then you will see your default browser show the content like the example image.

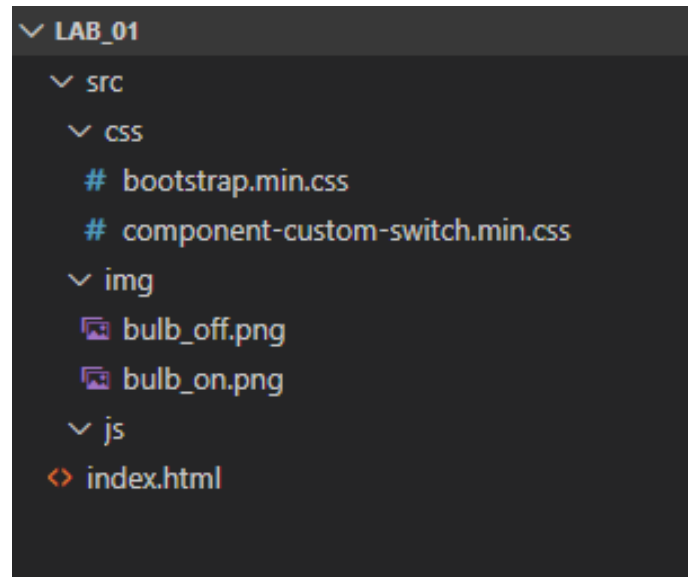

Open it directly
from chrome

Lab0 - Light Switch !

Place Files

- After opening html file on chrome successfully, now we can place files which TAs provide into corresponding folders.

Add Image & Button

- Now, we can add light bulb image & switch button to our html code.
- Modify the content of **body** tag.

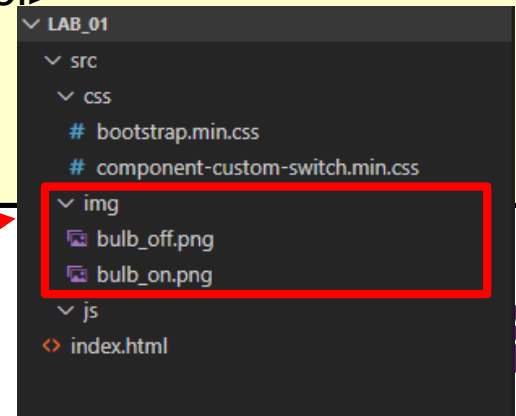

Add Image & Button

- Paste the example code into it.

```
<body style="background-color: black;">
  <div class="container text-center">
    <h1 style="color: aliceblue; margin-top: 30px;">Lab0 - Light Switch !</h1>
    <div>
      <img src='src/img/bulb_off.png' id="bulb" width="315" height="500">
    </div>
    <div class="custom-switch custom-switch-label-onoff pl-0">
      <input class="custom-switch-input" id="switch" type="checkbox"
onclick="switchLight();">
      <label class="custom-switch-btn" for="switch"></label>
    </div>
  </div>
</body>
```

src value is the path which links to the image files !

Add Image & Button

Lab0 - Light Switch !

Problem

- We can notice that the style of switch button is different from the demo, and it also has no effect.

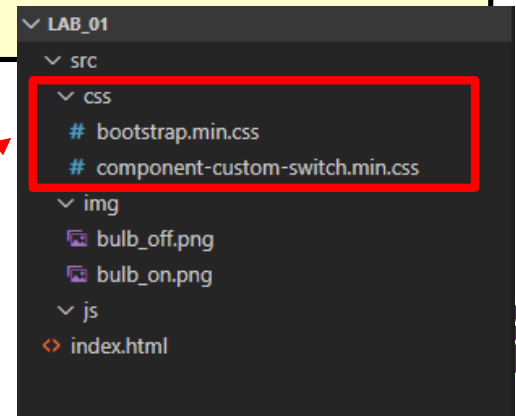

Link Files

- We need to link the CSS files which we just added to change the style of the switch button.
- Paste the example code into it.

```
<head>
  <title>Lab0-Example</title>
  <link href="src/css/bootstrap.min.css" rel="stylesheet">
  <link href="src/css/component-custom-switch.min.css" rel="stylesheet">
</head>
```

href value is the path which links to the CSS files !

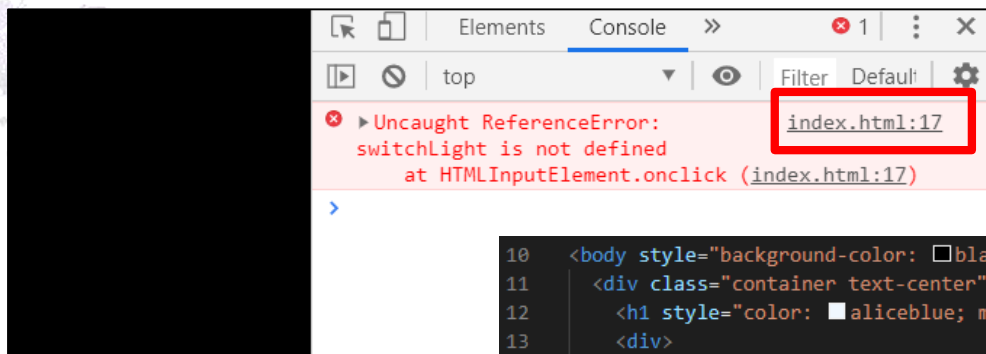

Problem

- We can notice that we have the correct style of the switch, but it still has no effect.
- After pressing **F12**, we can find that there are some errors when we press the button.

Problem

- There are some errors at **line 17** in index.html.
- The error messages says that the **switchLight** function is not defined.

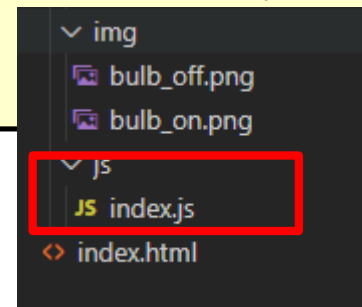

```
10 <body style="background-color: black;">
11 <div class="container text-center">
12   <h1 style="color: aliceblue; margin-top: 30px;">Lab0 - Light Switch !</h1>
13   <div>
14     <img src='src/img/bulb_off.png' id="bulb" width="315" height="500">
15   </div>
16   <div class="custom-switch custom-switch-label-onoff pl-0">
17     <input class="custom-switch-input" id="switch" type="checkbox" onclick="switchLight();"
18     <label class="custom-switch-btn" for="switch"></label>
19   </div>
20 </div>
21 </body>
22
23 </html>
```

Add Switch Button Function

- Now we need to define **switchLight** function to implement the function of switch.
- Add **index.js** file in **js** folder.
- Paste the following code in html **head** tag to link js file.

```
<head>
  <title>Lab0-Example</title>
  <link href="src/css/bootstrap.min.css" rel="stylesheet">
  <link href="src/css/component-custom-switch.min.css" rel="stylesheet">
  <script src="src/js/index.js"></script>
</head>
```

src value is the path which links to the js files !

Edit JS File

- Paste the example code into it.

```
var mySwitch;  
var myBulb;  
  
window.onload = function() {  
    mySwitch = document.getElementById('switch');  
    myBulb = document.getElementById('bulb');  
};  
function switchLight() {  
    if(mySwitch.checked)  
        myBulb.src = 'src/img/bulb_on.png';  
    else  
        myBulb.src = 'src/img/bulb_off.png';  
}
```

Finish !

Notice !

- Remember to sign your name before you leave the lab class. Even if you have given the studentID.

Try it!

Extra Selection

- Aside from filling out the **application for extra selection** in the **Academic Information System**, please also fill out this **survey**.
