Physics Tutorial

Hung-Kuo Chu

Department of Computer Science
National Tsing Hua University

CS2410

Goal

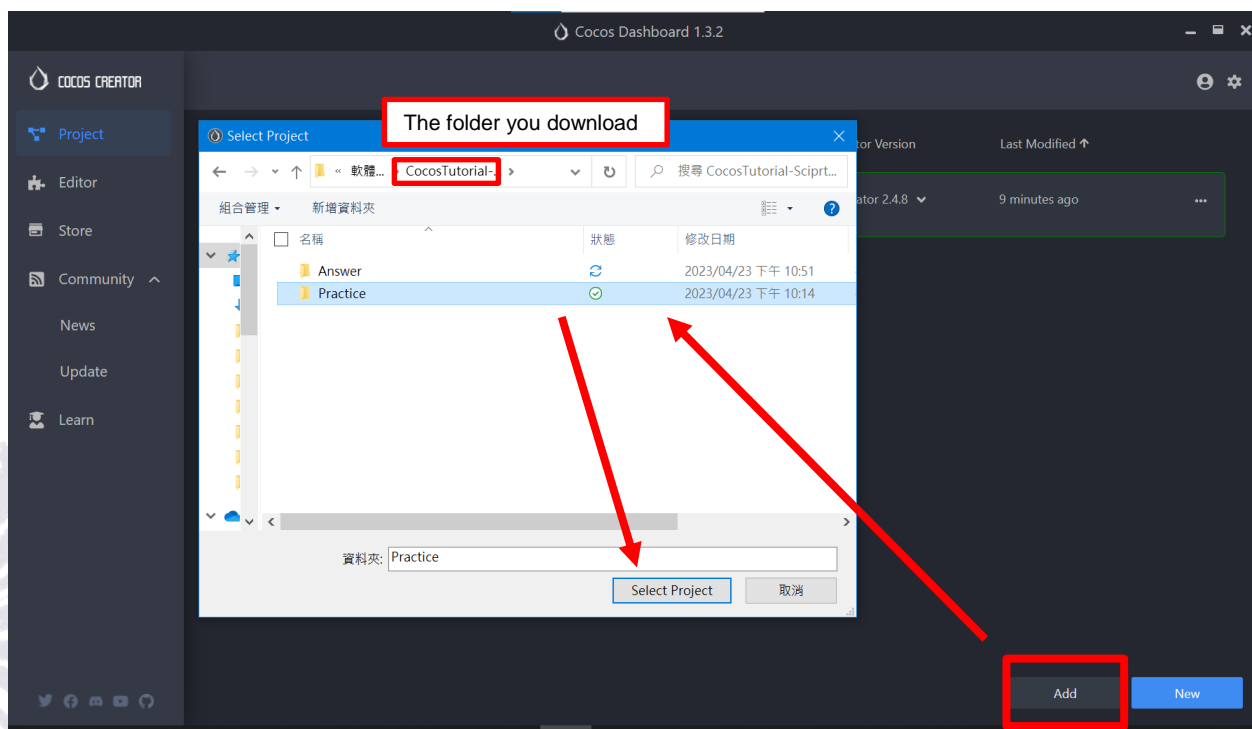

Contents

- Update score
- Contact with pigs
- Trigger with game item
- What you can do more:
 - Add Effect Sound.
 - Add more effect.

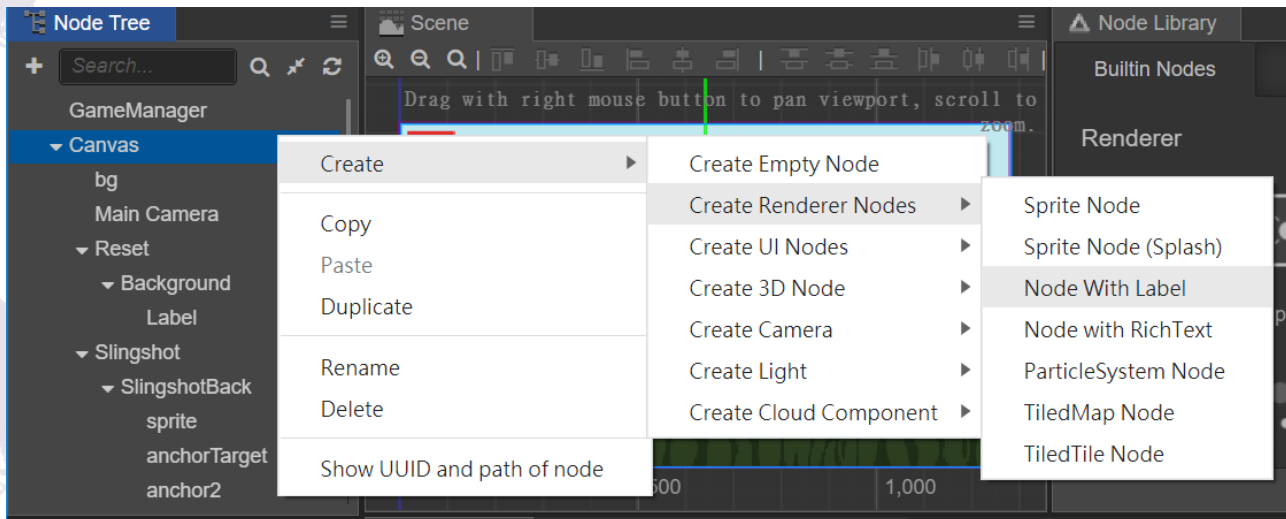

Open the Project

- Step1. Download project from eeclass or GoogleDrive and unzip
 - <https://reurl.cc/VzRmmZ>
- Step2. Add the Practice folder to Cocos

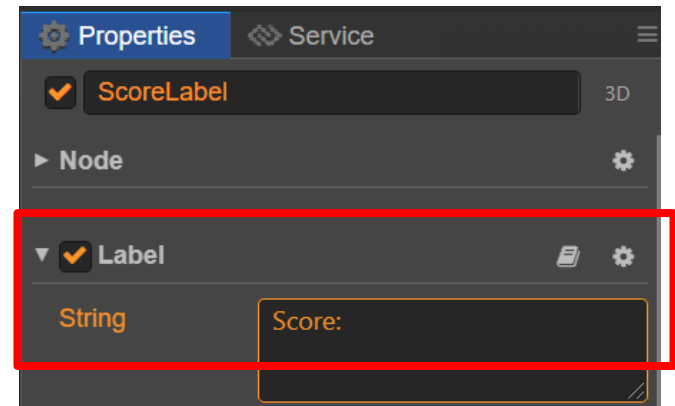

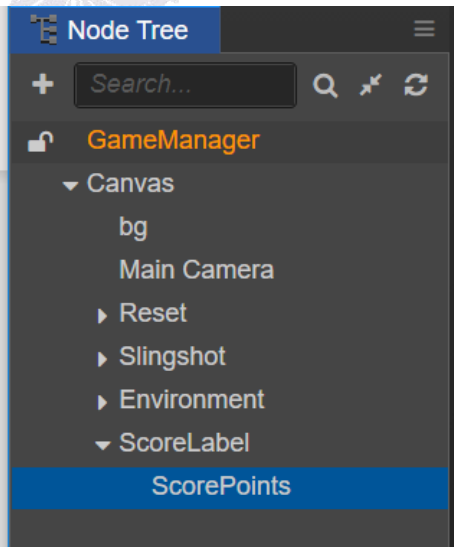

Create a Score Node

- Step1. Switch to main scene
 - assets/Scenes/main
- Step2. Create two Label node to show score
 - Right Click Canvas
 - Create/Create Renderer Nodes/Node With Label

Create a Score Node

- Step3. Rename one node to “ScoreLabel” and the other to “ScorePoints”
- Step4. Drag ScorePoints to ScoreLabel as child
- Step5. Find a good position and color
- Step6. Set the label string

Set up Score Property

- Step1. In bird.ts, define score for record the score point number and scorePoints for the ScorePoints node (TODO 1.1)
 - assets/Scripts/bird.ts
- Step2. Initialize the score to 0 when start (TODO 1.2)
 - assets/Scripts/bird.ts start()

```
24 // ===== TODO 1.1 =====
25 // 1. Define score related property.
26 score: number;
27
28 @property(cc.Node)
29 scorePoints = null;
30 // =====
```

```
46 start() {
47     this.initProperties();
48     this.initResetButton();
49     // ===== TODO 1.2 =====
50     // 1. Initialize the score to 0 when start.
51     this.score = 0;
52     // =====
53 }
```

Set up Update function

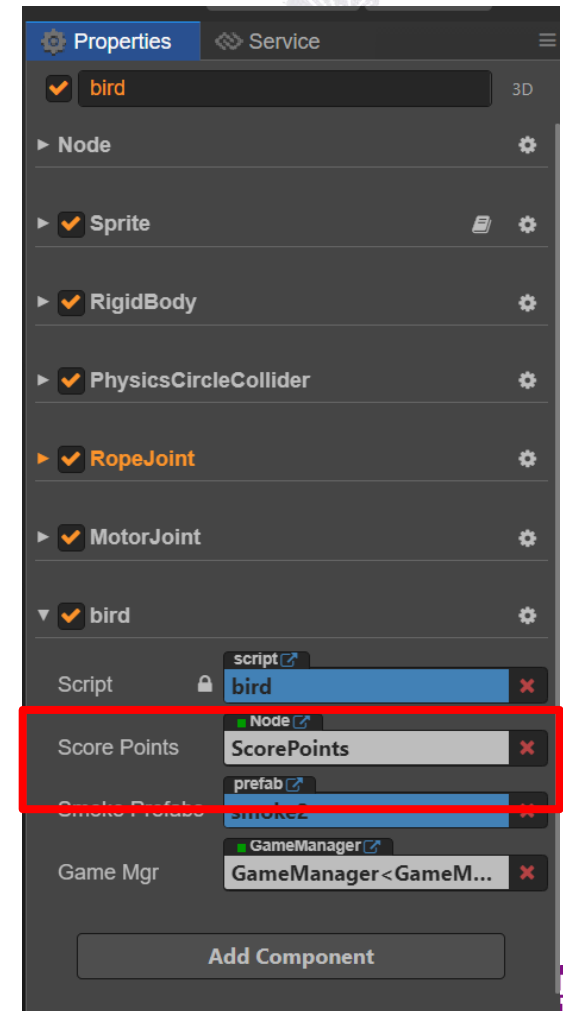

- Step1. Create a function updateScore() to update the score points (TODO 1.3)

```
197 // ===== TODO 1.3 =====
198 // 1. Add a function to update score point
199 // (Hint: You can use number.toString() function to convert number to string)
200 updateScore(number) {
201     this.score += number;
202     this.scorePoints.getComponent(cc.Label).string = this.score.toString();
203 }
204 // =====
```

Add Node to the Component

- Step1. Drag ScorePoints node into Score Points of bird node's bird component

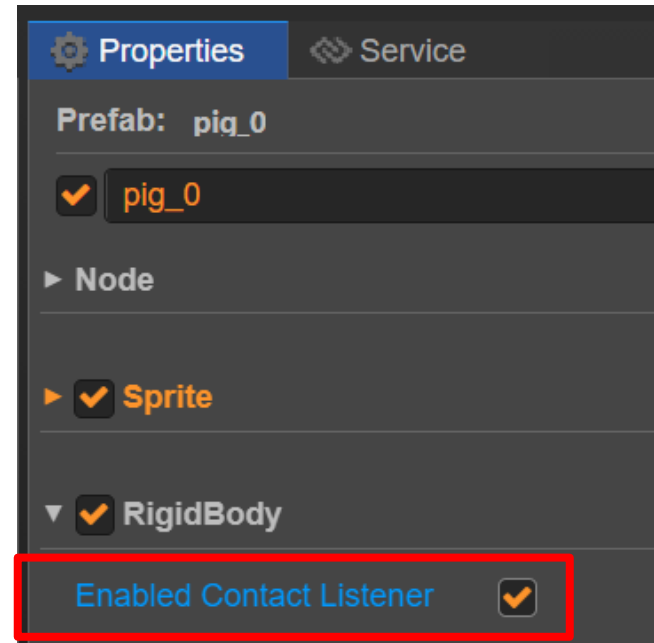

**Your
turn!**

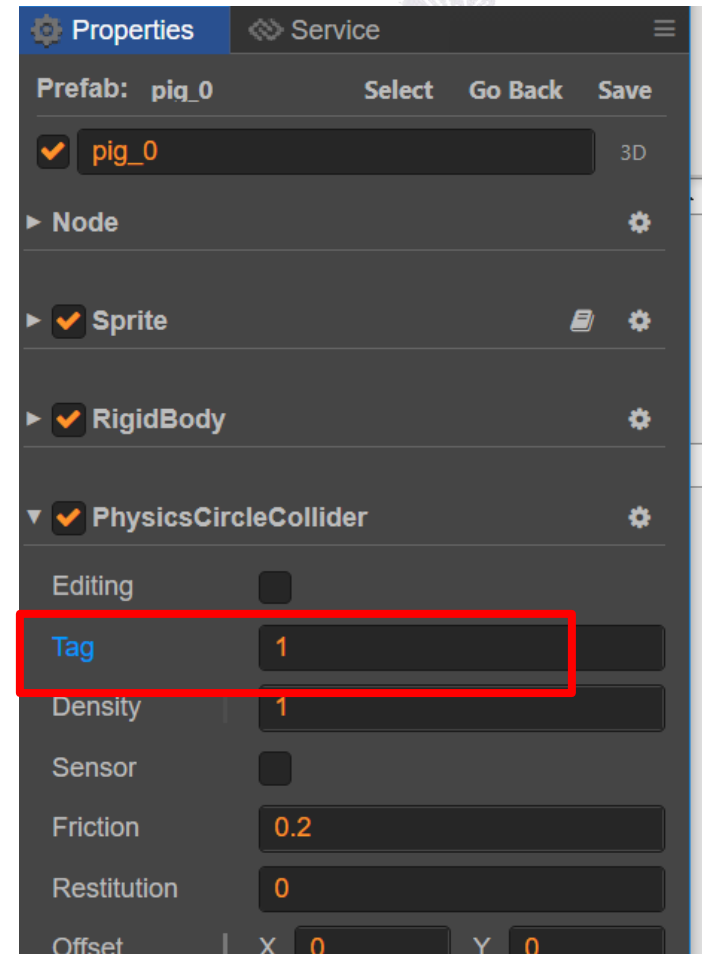

Contact with Pigs

- Step1. Find the pig prefab
 - Double click pig_bg and pig_sm
 - assets/Prefabs/pig_bg and pig_sm
- Step2. Enabled Contact Listener
 - Go to property tab
 - Find Rigidbody Component
 - Check Enabled Contact Listener

Set up Collider

- Step1. Change the tag
 - Find PhysicsCircleCollider Component
 - Set the Tag to 1

Set up Contact function

- Step1. In bird.ts, write onBeginContact() (TODO 2.1.1)
 - assets/Scripts/bird.ts
- Step2. Use tag to figure out which object we're contact with. (TODO 2.1.2)
- Step3. Instantiate smoke prefab (TODO 2.1.2-1)
- Step4. Use this.scheduleOnce to destroy smoke prefab after 1.5s(TODO 2.1.2-2)

Set up Contact function

- Step4. Update the score (TODO 2.1.2-3)
- **Contact** objects include collision points and the normal vector, which are acquired by `getWorldManifold()`

```
210     onBeginContact(contact, self, other) {
211         if (other.tag == 1) { // enemy tag
212             console.log("BeginContact")
213             console.log(contact.getWorldManifold().points);
214
215             var smoke = cc.instantiate(this.smokePrefabs);
216             smoke.setPosition(contact.getWorldManifold().points[0]);
217
218             cc.find("Canvas/Environment").addChild(smoke);
219             this.scheduleOnce(function () {
220                 smoke.destroy();
221             }, 1.5);
222
223             this.updateScore(30);
224         }
225         // =====
```

Set up Contact function

- Step5. Write onEndContact() (TODO 2.2)
- Step6. Change the tag of pigs in order not to instantiate smoke any more

```
243 // ===== TODO 2.2 =====
244 // 1. Set up onEndContact.
245 // 2. Change the tag of pigs' in order not to instantiate smoke any more.
246 onEndContact(contact, self, other) {
247     if (other.tag == 1) other.tag = 0;
248 }
249 // =====
```

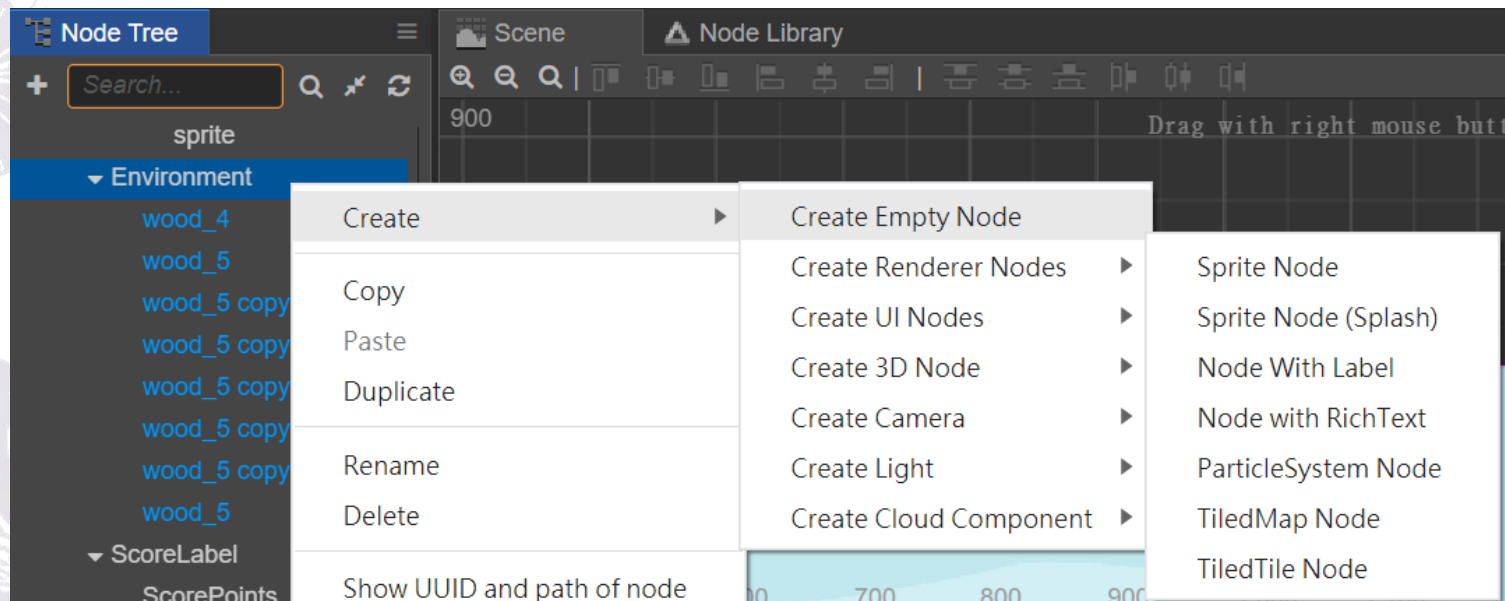

**Your
turn!**

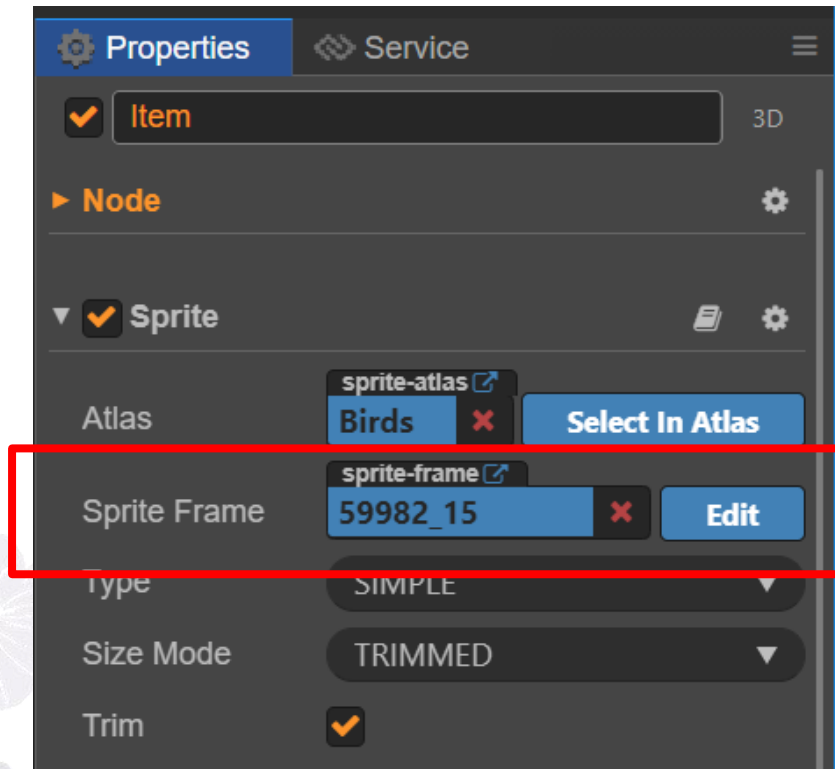

Create a Game Item Node

- Step1. In main scene, create a Sprite Node
 - Right Click Environment
 - Create/Create Renderer Nodes/Sprite Node
- Step2. Rename the node to “Item”

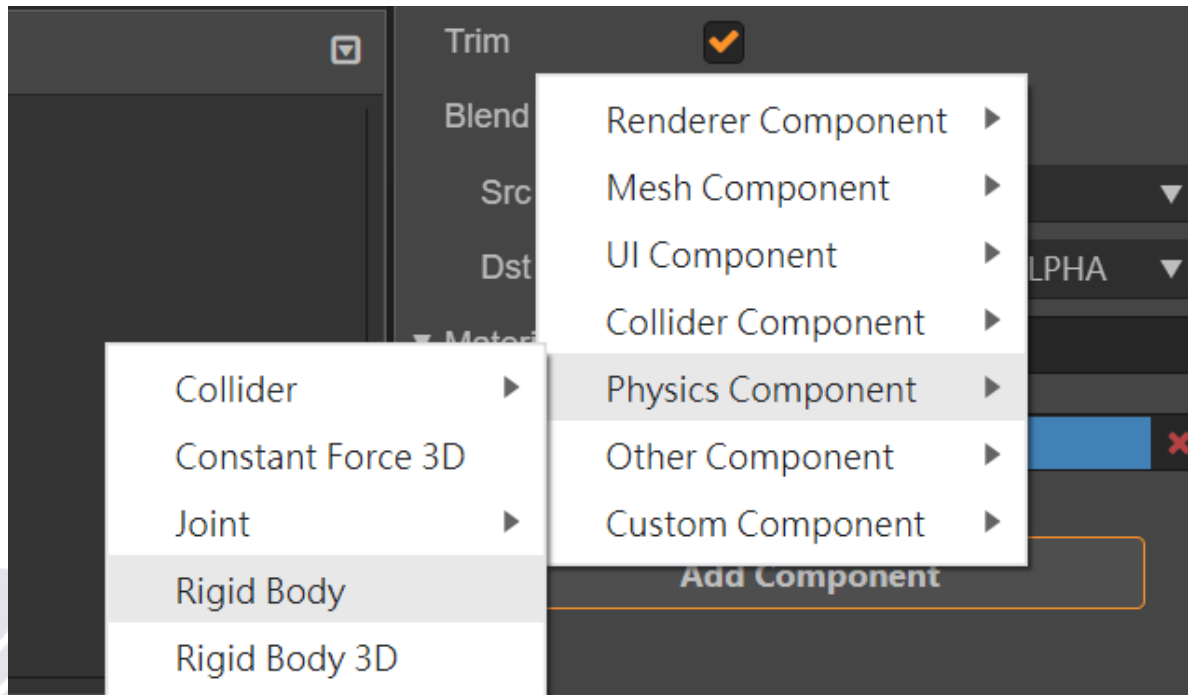

Create a Game Item Node

- Step3. Find a good picture for the Sprite Frame
 - assets/Images

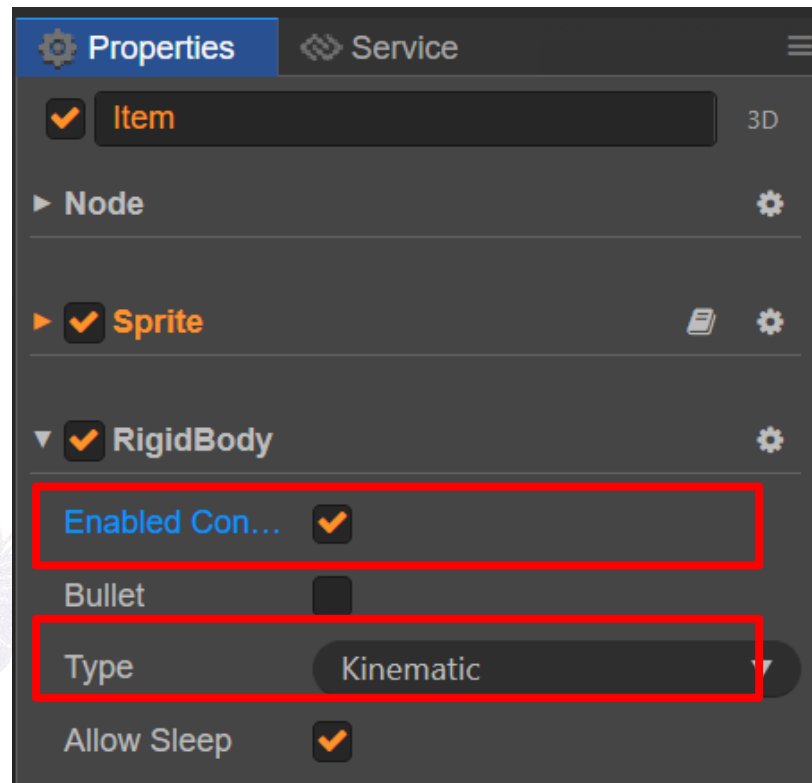

Set up Rigid Body

- Step1. Add Rigid Body Component to Item node
 - Add Component/Physics Component/Rigid Body

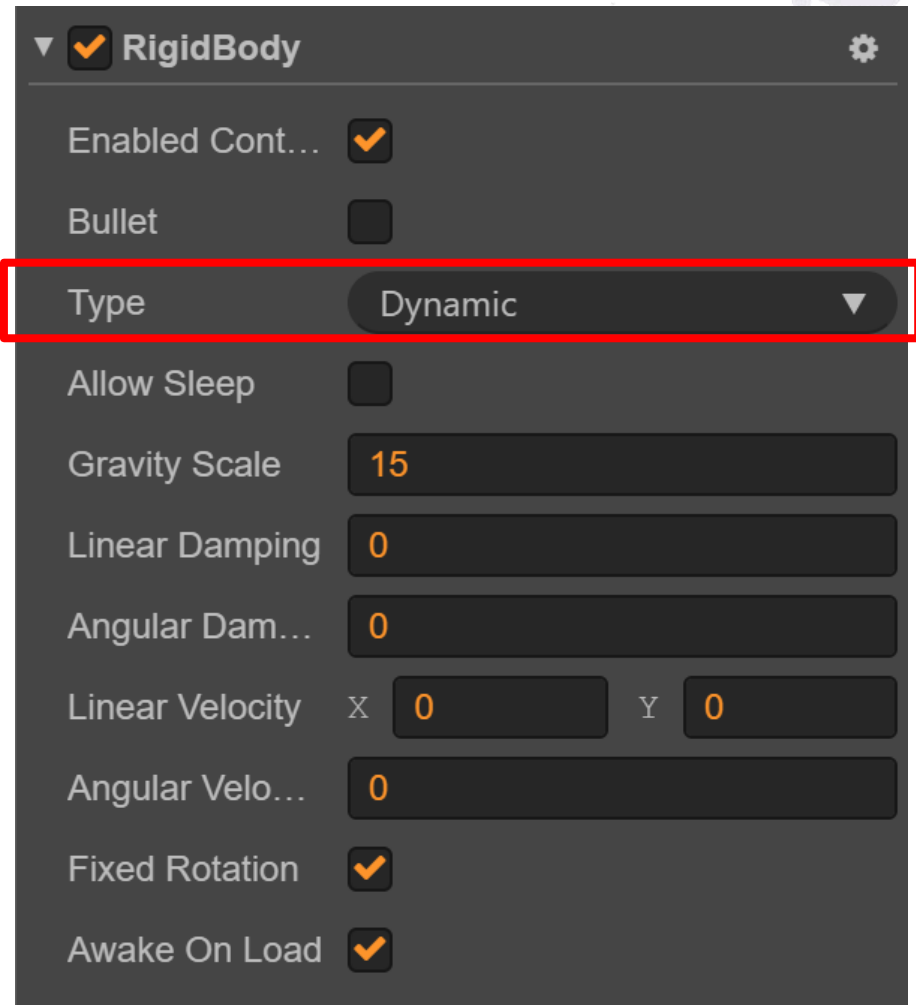

Set up Rigid Body

- Step2. Enabled Contact Listener
- Step3. Change the Type to Kinematic

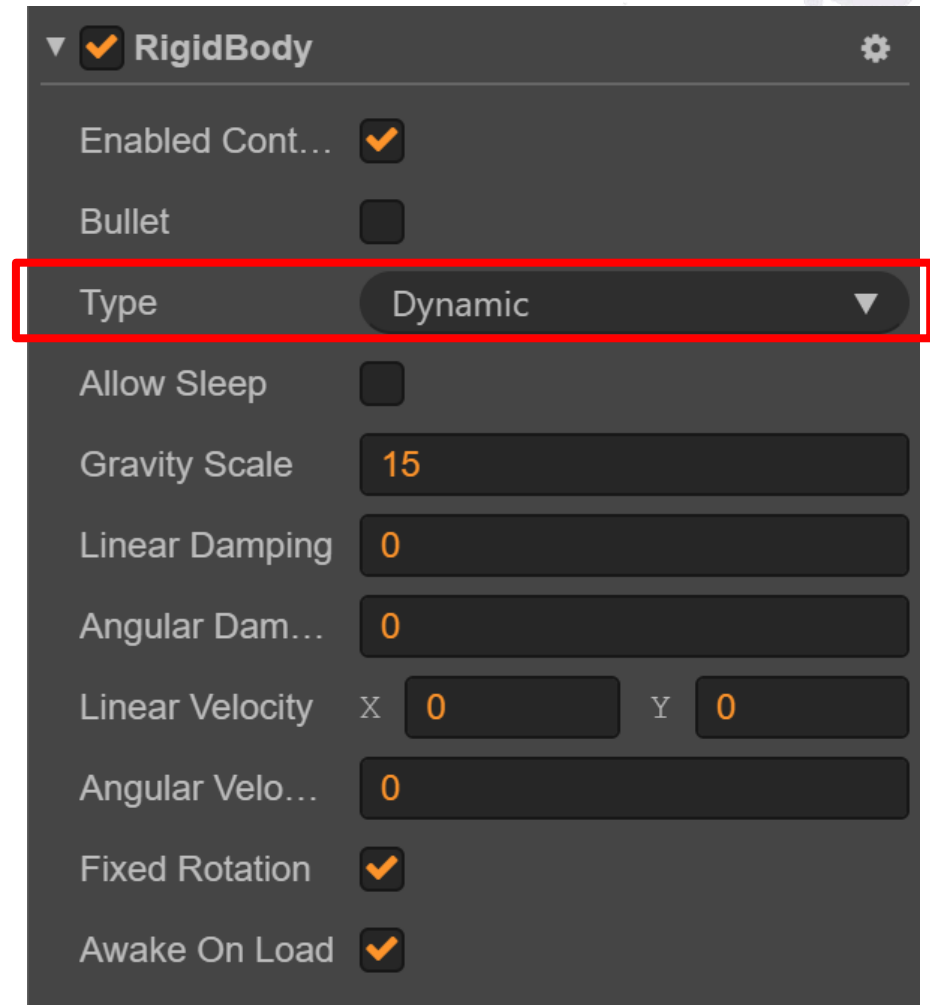

Rigid Body: Types

- **Static:** zero mass, zero velocity, that is not affected by gravity or force, but can set its position to move.
- **Dynamic:** with mass, its velocity can be set, will be affected by gravity.

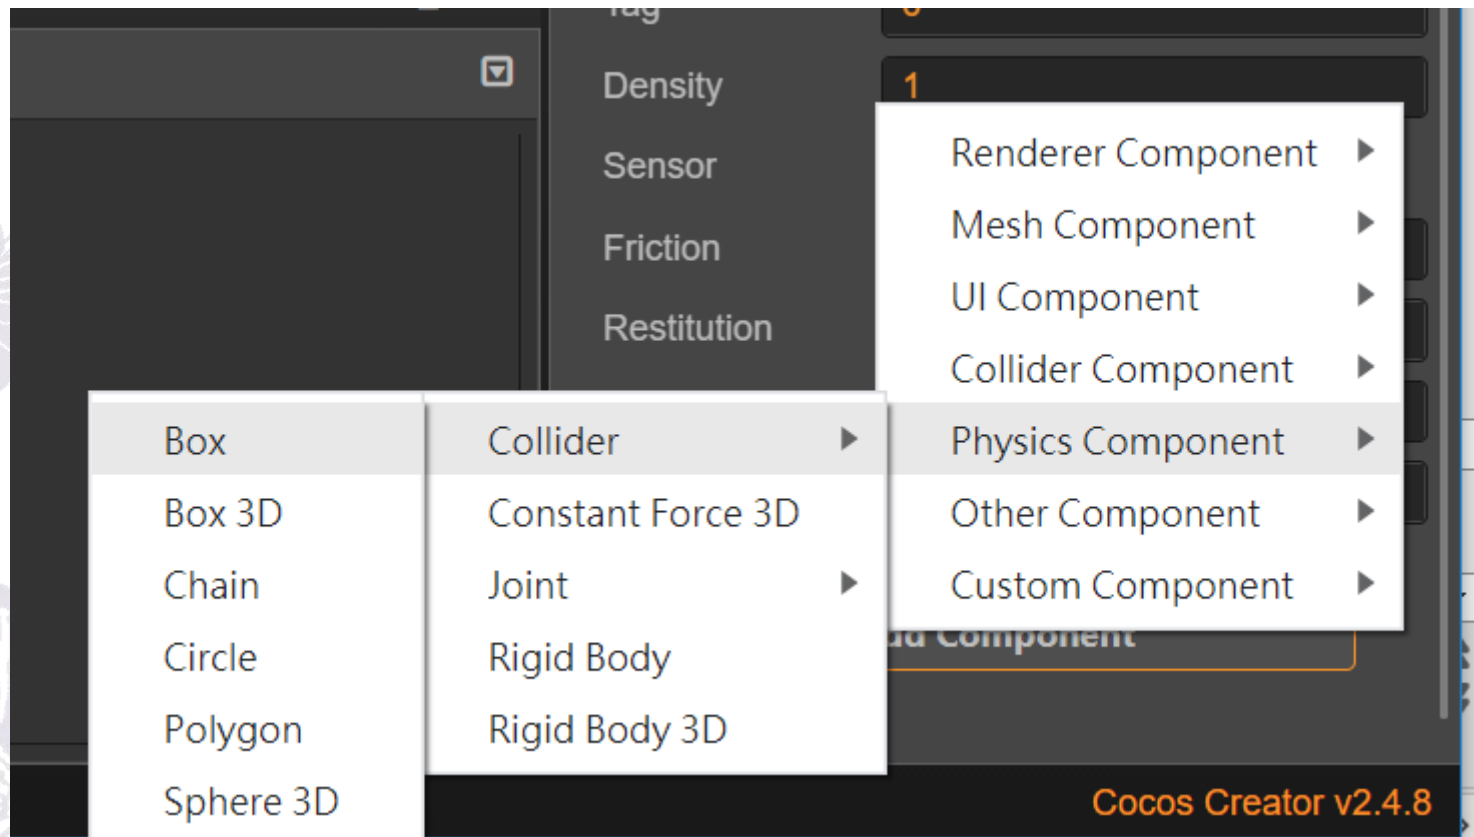

Rigid Body: Types

- **Kinematic:** zero mass, its velocity can be set, will not be affected by gravity, but can move by setting the velocity.
- **Animated:** derived from Kinematic type, mainly used for rigidbody and animation in combination (We won't cover this part).

Set up Collider

- Step1. Add PhysicsBoxCollider to Item node
 - Add Component/Physics Component/Collider/Box

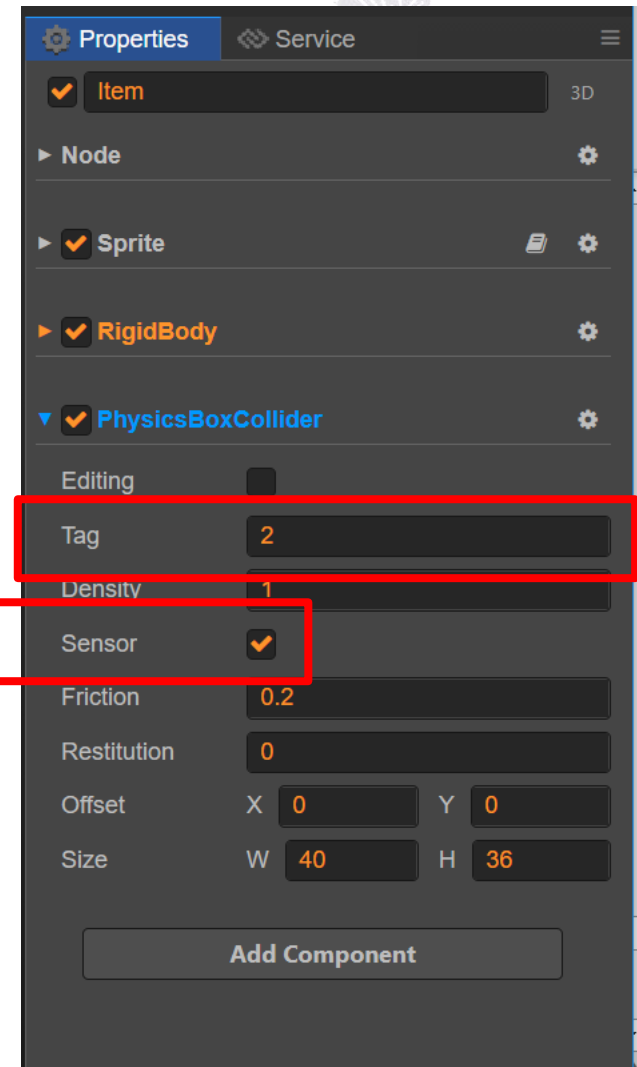

Set up Rigid Body

- Step2. Enabled Sensor to trigger (enable collision callback, but no physical collision effect will occur)
- Step3. Set the Tag to 2

Collision effect w/o sensor enabled

Set up Contact function

- Step1. In bird.ts, find the onBeginContact()
 - assets/Scripts/bird.ts
- Step2. Use tag to figure out item(TODO 3)
- Step3. Destroy the item (TODO 3.1)
- Step4. Add 10 score points (TODO 3.2)

```
227 // ===== TODO 3 =====
228 // 3. if contact with item.
229 // 3-1. Destroy the item.
230 // 3-2. Add 10 points.
231 else if (other.tag == 2) { // game item tag
232
233     console.log("Trigger");
234
235     other.node.destroy();
236     this.updateScore(10);
237 }
238 // =====
```

**Your
turn!**
